It explores the role of non-extensive statistical mechanics in non-equilibrium thermodynamics, and presents
an overview of the strong nonlinearity of chaos and complexity in natural systems that draws on the relevant
mathematics from topology, measure-theory, inverse and ill-posed problems, set-valued analysis, and
nonlinear functional analysis.

Chaos versus complexity. We can now consider further the similarities and differences between chaotic systems and complex systems. Each shares common features, but the two concepts are very different. Chaos is the generation of complicated, aperiodic, seemingly random behaviour from the iteration of a simple rule. This complicatedness is not complex in the sense of complex systems science, but rather it is chaotic in a very precise mathematical sense.

A model of normal and abnormal cell cycle oscillations has been developed incorporating systems science, complexity, and chaos theories. Using this model, cancer expresses a failing subsystem and is characterized by a positive exponential growth taking place in the outer edge of chaos. The overall survival of human body as a system is threatened.
